Abstract
A clear and well-documented \LaTeX document is presented as an article formatted for publication by CEUR-WS in a conference proceedings. Based on the "ceurart" document class, this article presents and explains many of the common variations, as well as many of the formatting elements an author may use in the preparation of the documentation of their work.

Keywords
\LaTeX class, paper template, paper formatting, CEUR-WS

1. Introduction

CEUR-WS's article template provides a consistent \LaTeX style for use across CEUR-WS publications, and incorporates accessibility and metadata-extraction functionality. This document will explain the major features of the document class.

If you are new to publishing with CEUR-WS, this document is a valuable guide to the process of preparing your work for publication.

The "ceurart" document class can be used to prepare articles for any CEUR-WS publication, and for any stage of publication, from review to final "camera-ready" copy with very few changes to the source.

This class depends on the following packages for its proper functioning:

- \natbib.sty for citation processing;
- geometry.sty for margin settings;
- graphi.c.sty for graphics inclusion;
- hyperref.sty optional package if hyperlinking is required in the document;
- fontawesome5.sty optional package for bells and whistles.

All the above packages are part of any standard \LaTeX installation. Therefore, the users need not be bothered about downloading any extra packages.

2. Modifications

Modifying the template — including but not limited to: adjusting margins, typeface sizes, line spacing, paragraph and list definitions, and the use of the \textbackslash v{space} command to manually adjust the vertical spacing between elements of your work — is not allowed.

3. Template parameters

There are a number of template parameters which modify some part of the ceurart document class. This parameters are enclosed in square brackets and are a part of the \texttt{documentclass[parameter]} command:

\begin{verbatim}
\documentclass[parameter]{ceurart}
\end{verbatim}

Frequently-used parameters, or combinations of parameters, include:

- \texttt{twocolumn}: Two column layout.
- \texttt{hf}: Enable header and footer.

4. Front matter

4.1. Title Information

The titles of papers should be either all use the emphasizing capitalized style or they should all use the regular English (or native language) style. It does not make a good impression if you or your authors mix the styles.

Use the \texttt{title} command to define the title of your work. Do not insert line breaks in your title.

4.2. Authors and Affiliations

Each author must be defined separately for accurate metadata identification. Multiple authors may share one affiliation. Authors’ names should not be abbreviated; use full
first names wherever possible. Include authors’ e-mail addresses whenever possible.

\author command have the below options:

- style: Style of author name (chinese)
- prefix: Prefix
- suffix: Suffix
- degree: Degree
- role: Role
- orcid: ORCID
- email: E-mail
- url: URL

Author names can have some kinds of marks and notes:

- affiliation mark: \author[<num>].

The author names and affiliations could be formatted in two ways:

1. Group the authors per affiliation.
2. Use an explicit mark to indicate the affiliations.

Author block example:

\author[1,2]{Author Name} \%
prefix=Prof.,
degree=D.Sc.,
role=Researcher,
orcid=0000-0000-000-0000,
email=name@example.com,
url=https://name.example.com
\address[1]{Affiliation #1}
\address[2]{Affiliation #2}

4.3. Abstract and Keywords

Abstract shall be entered in an environment that starts with \begin{abstract} and ends with \end{abstract}.

\begin{abstract}
This is an abstract.
\end{abstract}

The key words are enclosed in a \{keyword\} environment. Use \sep to separate keywords.

\begin{keywords}
First keyword \sep
Second keyword \sep
Third keyword \sep
Fourth keyword
\end{keywords}

At the end of front matter add \maketitle command.

5. Sectioning Commands

Your work should use standard \LaTeX sectioning commands: section, subsection, subsubsection, and paragraph. They should be numbered; do not remove the numbering from the commands.

Simulating a sectioning command by setting the first word or words of a paragraph in boldface or italicized text is not allowed.

6. Tables

The "ceurart" document class includes the "booktabs" package — https://ctan.org/pkg/booktabs — for preparing high-quality tables.

Table captions are placed above the table.

Because tables cannot be split across pages, the best placement for them is typically the top of the page nearest their initial cite. To ensure this proper "floating" placement of tables, use the environment \table to enclose the table's contents and the table caption. The contents of the table itself must go in the \tabular environment, to be aligned properly in rows and columns, with the desired horizontal and vertical rules.

Immediately following this sentence is the point at which Table 1 is included in the input file; compare the placement of the table here with the table in the printed output of this document.

To set a wider table, which takes up the whole width of the page's live area, use the environment \table* to enclose the table's contents and the table caption. As with a single-column table, this wide table will "float" to a location deemed more desirable. Immediately following this sentence is the point at which Table 2 is included in the input file; again, it is instructive to compare the placement of the table here with the table in the printed output of this document.

7. Math Equations

You may want to display math equations in three distinct styles: inline, numbered or non-numbered display. Each of the three are discussed in the next sections.

7.1. Inline (In-text) Equations

A formula that appears in the running text is called an inline or in-text formula. It is produced by the math environment, which can be invoked with the usual \begin{\ldots} \end{\ldots} construction or with the short form $\ldots$. You can use any of the symbols and structures, from \(\alpha\) to \(\omega\), available in \LaTeX [1]; this section will simply show a few examples of in-text equations in context. Notice how this equation: \(\lim_{n \to \infty} \frac{1}{n} = 0\), set here in in-line math style,
Table 1  
Frequency of Special Characters  

<table>
<thead>
<tr>
<th>Non-English or Math</th>
<th>Frequency</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ø</td>
<td>1 in 1,000</td>
<td>For Swedish names</td>
</tr>
<tr>
<td>π</td>
<td>1 in 5</td>
<td>Common in math</td>
</tr>
<tr>
<td>$</td>
<td>4 in 5</td>
<td>Used in business</td>
</tr>
<tr>
<td>$Ψ_i$</td>
<td>1 in 40,000</td>
<td>Unexplained usage</td>
</tr>
</tbody>
</table>

Table 2  
Some Typical Commands  

<table>
<thead>
<tr>
<th>Command</th>
<th>Number</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>\author</td>
<td>100</td>
<td>Author</td>
</tr>
<tr>
<td>\table</td>
<td>300</td>
<td>For tables</td>
</tr>
<tr>
<td>\table*</td>
<td>400</td>
<td>For wider tables</td>
</tr>
</tbody>
</table>

7.2. Display Equations  
A numbered display equation—one set off by vertical space from the text and centered horizontally—is produced by the equation environment. An unnumbered display equation is produced by the displaymath environment.

Again, in either environment, you can use any of the symbols and structures available in \LaTeX; this section will just give a couple of examples of display equations in context. First, consider the equation, shown as an inline equation above:

\[
\lim_{n \to \infty} \frac{1}{n} = 0. 
\]  
(1)

Notice how it is formatted somewhat differently in the displaymath environment. Now, we’ll enter an unnumbered equation:

\[ S_n = \sum_{i=1}^{n} S_i, \]

and follow it with another numbered equation:

\[
\lim_{x \to 0} (1 + x)^{1/x} = e \]  
(2)

just to demonstrate \LaTeX’s able handling of numbering.

8. Figures  
The ”figure” environment should be used for figures. One or more images can be placed within a figure. If your figure contains third-party material, you must clearly identify it as such, as shown in the example below.

Your figures should contain a caption which describes the figure to the reader. Figure captions go below the figure. Your figures should also include a description suitable for screen readers, to assist the visually-challenged to better understand your work.

Figure captions are placed below the figure.

9. Citations and Bibliographies  
The use of \BibTeX for the preparation and formatting of one’s references is strongly recommended. Authors’ names should be complete — use full first names (“Donald E. Knuth”) not initials (“D. E. Knuth”) — and the salient identifying features of a reference should be included: title, year, volume, number, pages, article DOI, etc.

The bibliography is included in your source document with these two commands, placed just before the \end{document} command:

\bibliography{bibfile}  

where ”bibfile” is the name, without the ”.bib” suffix, of the \BibTeX file.

9.1. Some examples  
A paginated journal article [2], an enumerated journal article [3], a reference to an entire issue [4], a monograph
